

Comment of Universal black hole

The "black hole" in the universe is unanimously guessed by the world circles that there is an entity deep in the black hole, with a super strong gravity, which is enough to draw light into the celestial body to form a black hole.

The premise of the conjecture is that "light" must also have "quality", which alone will involve all aspects and overturn too many relevant physical concepts and theories.

At the very least, the speed of light will no longer be a constant of linear propagation, but a vector of environmentally changing direction and values.

Are the real Milky Way or galaxies farther away from Earth still what we see them looking like? and astronomical observations and "light years" based on linear light propagation will become meaningless.
