

## Again comment of "Submarine battle group"

"Diving mother ship" is a new technical solution to improve the attack resistance, improve the attack capability, and reduce the manufacturing and maintenance costs.

The existing submarines have many fatal weaknesses:

Due to the special mission of the submarine, the submarine is not suitable to carry the anti-aircraft weapon, and it is difficult to deal with the siege of the opponent too. Once found, it will lead to fierce attacks, often in a completely passive position, and the self-protection ability of the submarine is very poor. Therefore, in order to avoid being detected, such as sound-absorbing materials, engine and propeller noise reduction has become the key core technologies and difficulties related to the survival of the submarine.

Even with an increase in the size of the submarine, the number of weapons carried is limited, limiting its attack capability.

Modern submarines are made more and more complex, along with the overall strength of the structure, a series of problems such as power system, static noise, and stealth, all make their manufacturing and maintenance costs greatly increased, making them extremely expensive.

Through this method, the above disadvantages of modern submarine are completely solved, and the following effects are achieved:

Because the submersible mother ship is not afraid of being found, not afraid of any form of attack, it does not have to be entangled in the "sound absorption", "noise reduction" and other key problems facing modern submarines.

The submarine ship is powerful enough to destroy any type of warships, easy enough to sweep all targets on the surface and port, easy enough to block a large area of water for a long time, and is an invincible and unstoppable ocean overlord.

The mother carrier has the ability to travel long distances to kill targets in any sea.

Because the mothership is not afraid of any form of strike and long distance navigation ability, the mothership is the most safe and reliable nuclear vehicle, can be close to launch, it is difficult to prevent.

The manufacturing and maintenance cost of the submersible mother ship is very low.

This method is a new scheme to improve modern submarines.

Officials have reported that the Chinese navy has successfully launched anti-aircraft missiles underwater. The submarine launches the anti-aircraft missile will expose its target, so the general submarine will not be equipped with this missile, this missile is the "submersible mother ship" special equipment.

During the crisis across the Taiwan Strait, it was reported that the Global Weekly commented that "when China and the United States go to war was the day of the demise of the aircraft carrier on earth too".

Obviously, can make the aircraft carrier die on the earth is the "Diving mother ship".

If lose the sea control and the guarantee of maritime passage, the overseas bases will be exhausted in wartime, and the contrast of ability will become a confrontation between a country and several isolated overseas bases, is such a war still needed?

World powers and including some small countries have nuclear weapons, but no one dares to really use nuclear weapons. In fact, nuclear weapons have only become an essential luxury decoration goods

What can have a profound impact on the world strategic pattern is the "Submersible mother ship".
